AB N-Sulfonyl aziridines undergo oxidative addition to palladium(0) complexes yielding azapalladacyclobutane amido-complexes, which rearrange to azapalladabicyclo[3.2.1]octanes via copper-catalyzed carbopalladation. Palladium(0) species generated in situ from Pd2(dba)3 and 1,10-phenanthroline undergo oxidative addition of 2-methyl-1-nosyl- and 2-(4-R-3-butenyl)-1-tosylaziridines (R = H, BuO2C), affording 3-Me- or 3-(RCH:CHCH2CH2)-1-X-2-(phen)-1,2-azapalladacyclobutanes (15, 8, 16, resp., same R; X = 4-NO2C6H4SO2, 4-MeC6H4SO2), whereas aziridines containing less electroneg. or saturated alkyl groups show no reaction. The resulting azapalladacyclobutane complexes undergo intramol. carbopalladation in the presence of copper(I) iodide to afford azapalladabicyclo[3.2.1]octanes (I, 17, R = H; 18, R = CO2Bu). A deuterium-labeling experiment indicates that the oxidative addition proceeds

via SN2-type attack of palladium(0) on the less-hindered carbon of the aziridine ring and that alkene insertion occurs in a syn-fashion. The azapalladabicyclo[3.2.1]octane complexes undergo oxidative palladium-carbon bond functionalization in the presence of copper(II) bromide.

OS CASREACT 140:391378; MARPAT 140:391378

AB The invention relates to a method for the production of a compound containing palladium(0), which consists in reacting a palladium compound with one or several compds. of general R1R2C:C(R3){(A)x}C(R6):CR4R5 (R1-R6 = halo, alkoxy, CN, NO2, amino, organocarbonyl, carboxy, amido, substituted alkenyl, organosilyl, organosulfonyl, organothio, organophosphino, etc.; A = organoalkenyl, O, S, organoamino, organosilyl, substituted ring, x = 2-4), cyclic [Si(R12)(C13CR14R15)O]n (n = 3-20, R12 = H, OH, (un)substituted C1-20 alkyl, OC1-10 alkyl, etc.; R13-R15 = halo, CN, NO2, alkyl, organoamino, organocarbonyl, organocarboxy, organoamido, substituted alkenyl, organosilyl, organosiloxy, organothio, organosulfonyl, organophosphino, etc.), or Term-O-{[Si(R16)(CR19CR17R18)O]v[Si(R20)2O]w}-Term (v, w = 1-1000; v+w = 0-1000; R16, R20 = H, OH, (un)substituted C1-10 alkyl, etc.; R17-R19 = halo, CN, NO2, alkyl, organoamino, organocarbonyl, organocarboxy, organoamido, substituted alkenyl, organosilyl, organosiloxy, organothio, organosulfonyl, organophosphino, etc.) in the presence of a base. Thus, reaction of sodium tetrachloropalladate with diallyl ether in presence of sodium hydrogen carbonate in MeOH gave 81% title compound in 4h. The compds. containing palladium(0) are suitable for use as homogeneous catalysts, as precursors in the in situ production of homogeneous catalysts or as precursors in the production of heterogeneous catalysts.

AB Phenoxycarbonylation of various allylic carbonates under various conditions in THF is described. The nature and ratio of the products formed are dependent on the presence of water, carbon monoxide pressure and addition of various inorg. halides. The formation of a product arising from dimerization of the allylic carbonate is discussed. The phenoxycarbonylation of (E)-cinnamyl Et carbonate gave (E)-4-phenyl-3-butenic acid Me ester and cinnamyl Ph ether.

OS CASREACT 116:129191

AB The palladium η³-allyl complex Pd(η³-C₃H₅)₂ reacts with bidentate phosphines iso-Pr₂PC₂H₄PPr-iso₂ and tert-Bu₂PC₂H₄PPBu-tert₂ below -30° to yield the light yellow, microcryst. palladium(II) η¹-allyl compds. (R₂PC₂H₄PR₂)Pd(η¹-C₃H₅)₂ (R = iso-Pr (I), tert-Bu (II), which are stable to about -30°. Above 30°, the allyl substituents of I and II couple with reduction of palladium to form a mixture of (R₂PC₂H₄PR₂)Pd₀ 1,5-hexadiene complexes. When this reaction is

carried out in 1,5-hexadiene, the complex (R2PC2H4PR2)Pd(η^2 -C6H10) R = iso-Pr (III), tert-Bu (IV) are obtained in pure form. According to IR and NMR spectral data, the palladium atoms in III and IV are coordinated at low temperature by the chelating diphosphane and (statically) by one of the 2 diene double bonds in a trigonal-planar geometry. At higher temps., a rapid exchange of the coordinated and uncoordinated double bonds occurs, passing through an intermediated with C2 symmetry. When suspension of I in pentane and II and THF are warmed to 20°, dinuclear diastereomers rac-meso-(R2PC2H4PR2)Pd)2 (μ - η^2 : η^2 -C6H10) are obtained, which upon treatment with 1,5-hexadiene furnish mononuclear derivs. III and IV. Similarly, when I is reacted with 1,5-cyclooctadiene at 20°, the mono- and dinuclear interconvertible complexes (iso-Pr2PC2H4PPr-iso2)Pd(η^2 -C8H12) and {(iso-Pr2PC2H4PPr-iso2)Pd}2(μ - η^2 : η^2 -C8H11) are produced. From the reaction of I and II with ethene, stable complexes (R2PC2H4PR2)Pd(C2H4) (V), result. The colorless mononuclear palladium(0) ethyne complexes (R2PC2H4PR2)Pd(C2H2) may be prepared (a) by a displacement reaction of one of the isolated alkene complexes with ethyne, (b) by a reductive elimination and concomitant displacement reaction of the η^1 -allyl complexes I and II with ethyne, or (c) in a one-pot synthesis from either Pd(η^3 -C3H5)2 or Pd(η^3 -2-MeC3H4)2 with iso-Pr2PC2H4PPr-iso2 or tert-Bu2PC2H4PBu-tert2, resp., and ethyne in excess. When the mononuclear ethyne complexes V are combined with an equimolar amount of the corresponding η^1 -allyl complex I or II, or the alkene complexes, yellow dinuclear palladium(0) complexes {(R2PC2H4PR2)Pd}2(μ -C2H2) are produced, in which the ethyne ligand bridges 2 Pd atoms. All the diphosphine) palladium(0) alkene and ethyne complexes exhibit a trigonal-planar coordination geometry about the Pd atom. Most of the compds. have been isolated in high yield.

OS CASREACT 109:230210

AB In the presence of catalytic amts. of (Ph3P)4Pd, fluoroalkyl iodides react readily with alkenes under mild conditions to give the corresponding adducts in high yields. Dichlorobis(triphenylphosphine)palladium or fluoroalkylbis(triphenylphosphine)palladium iodide fails to induce the reaction under the same conditions. Diiodobis(triphenylphosphine)palladium, but not the fluoroalkylated complex of Pd, is formed in the reaction confirmed by XPS. The reaction can be partially suppressed by radical inhibitors, such as 2-nitro-2-nitrosopropane or di-tert-Bu nitroxide, but no effects are observed by the presence of oxygen in air of p-dinitrobenzene [molar ratio p-DNB:Pd0 = 1:1] unless an excess of p-DNB(10:1) was added. In the presence of diallyl ether, fluoroalkylated THF derivs. are formed. All these results indicate that a radical-chain process initiated by single electron transfer from palladium(0) to iodide might be involved. Also, the formation of

fluoroalkylbis(triphenylphosphine)palladium iodide is shown to proceed through a radical intermediate by ESR trapping techniques.

AB Partial hydrogenation of dienes using the title catalyst could be effected in swelling solvents, such as THF or benzene under 1 atm H₂ and 25°. The hydrogenation of hexadiene isomers results in the formation of 1-, 2- and 3-hexene, with <1% hexane formation up to consumption of the 1st equivalent H₂. Cyclohexadiene undergoes H transfer to form cyclohexene and benzene.
